DFW Airport

PILOT AND RESEARCH STUDY
Today’s airports are often stressful environments. Beyond the travel-related stressors of security screening and wayfinding, discomfort due to the physical environment can increase travelers fatigue and decrease the overall passenger experience. Discomfort due to poor acoustics, glare, or thermal control are common. In order to quantify the positive impacts of dynamic glass on passenger experience and revenue in an airport setting, a full-scale technology demonstration and research study was performed at the Dallas Fort Worth Airport in October 2017. View Dynamic Glass replaced the existing Low-E insulated glass in two locations of Terminal A - American Airlines’ Gate A28 and at the Twisted Root restaurant. Both locations are oriented due east and experience significant morning glare and heat gain throughout the year. For the study, the dynamic glass was operated in its automated Intelligence mode.

The existing Terminal A glazing is an insulated Solarban 70XL glass with an Arctic Blue mate light, that has a ceramic frit applied to the upper rows of glass in the gate areas.
In addition to the boarding area demonstration, the bar section of the Twisted Root restaurant also replaced the Low-E glass with dynamic glass. Since there wasn’t a simultaneous comparison, benefits were evaluated on past performance in this location. In October 2017, following the dynamic glass installation, the restaurant reported an 89% increase in alcohol sales over 2016. This trend was repeated in November 2017 with a 108% increase over December 2016. For the month period post-installation of the View Dynamic Glass, this represents an average 102% increase in revenue. Both restaurant staff and management report a qualitatively improved experience and a significant increase in profitability since the retrofit.

The Results

102% overall increase in revenue
Passenger experience in the DFW boarding areas was measured at two adjacent Terminal A gates. Gate A25 is a gate with existing Low-E glass and evaluated as the control for comparison to Gate A28, which was retrofit with dynamic glass. Over a 5 week period, more than 30 hours of boarding were monitored and evaluated. Customer seating was tracked via recorded video and 3rd party airport researchers who conducted over 500 in-person passenger surveys.

Gate Area Comparison Photos

Gate A25 (top right) with Low-E glass and Gate A28 (bottom right) with View Dynamic Glass. Both gates experience full sun penetration in the morning.
Passenger Comfort Study

The results show that dynamic glass significantly improves the passengers’ experience in the boarding area. The study found that passengers prioritize access to light and views as their second highest seating priority, outweighing electrical outlets and bathrooms in importance. The improvement in passenger comfort in the gate area led to an increase in dwell time of 83%. Visually, passengers preferred the aesthetic appearance of View Dynamic Glass 3-4x over the existing Low-E glass.

Without View Dynamic Glass
Passengers at Gate A25 (right) frequently used their body to shield their electronic devices from glare and wore sunglasses while at the gate.

83% longer dwell time with View Dynamic Glass

Infrared Testing

*Increased passenger comfort* was also directly observed via infrared (thermal) imaging. At the untreated gate, surface temperatures were up to 90 degrees Fahrenheit. At the dynamic glass gate, the surface temperatures on seats, carpets, glass, and passenger clothing and skin were *10 to 15 degrees cooler.*
In partnership with the DFW airport and 3rd party researchers, View was able to conclusively demonstrate significant improvements to passenger experience in both boarding area and restaurant environments. In both settings, passenger dwell times improved, and spending behavior increased. The technology is well received by travelers and airport staff.

83% Longer gate dwell time near View Dynamic Glass vs. standard glass

3-4x Preference for View Dynamic Glass by passengers

102% Higher spending in restaurant with View Dynamic Glass

#2 Access to views is the #2 seating priority for passengers at gate

15°C Cooler temp at gate with View Dynamic Glass

84% Passengers want to sit by windows with View
